Data handling

Station names, bike identifiers and membership tiers are shown **masked**. Those fields were AES-256-GCM encrypted before landing in Parquet, decrypted only inside the Hive stage, and written to the warehouse already masked under Apache Ranger policy — so no plaintext value exists in the warehouse this report reads. Masking applied by: **local-policy-engine (124)**. A partially-masked station name is the policy working as configured, not a rendering fault.
